ABSTRACT

PROBLEM TO BE SOLVED: To provide an RGB **backlight** display device and method for a portable telephone realizing favorable image quality by controlling an electric current flowing in each **LED** constituting the three primary colors for maintaining constant a luminous intensity irrespective of a desired display color.

SOLUTION: A control part 14 individually controls the timing of an output signal and 'Duty' of a rectangular wave generated at PWM part (R) 7, PWM part (G) 8, and PWM part (B) 9, causes each **LED** to emit light, and performs coloring of a desired display color. However, the total average electrical current flowing in an **LED** (RED) 1, an **LED** (GREEN) 2, and an **LED** (BLUE) 3 is maintained constant irrespective of the desired display color, and the intensity of each display color is maintained constant.

ABSTRACT

PURPOSE: To provide a liquid crystal image display device capable of obtaining an effect of reducing power consumption(power saving) and prolonging the life of a **back light** by lighting the **back light** for the screen of the liquid crystal image display device installed on various kinds of production facilities and machine tools, etc., only when it is necessary to watch display contents such as the operating condition of the machine, etc.

CONSTITUTION: A human body detecting sensor 5 is installed on the side part of the front surface of the liquid crystal display panel 3 equipped with the **back light** 2 behind a liquid crystal cell 1, and the **back light** 2 is lighted by the sensor 5 through a **back light** lighting control circuit 6 arranged by the side of the image display circuit 4 while the human body comes close to the display device and the human body stands near the display device, and when the human body goes away from the display device, the **back light** is turned off, or dimmed down. And also, the performance distance of the human body detecting sensor 5 is adjusted by a performance distance adjusting VR(voltage regulator) 7.

ABSTRACT EP 1150360 A2

A method of fabricating a compound semiconductor device having an ohmic electrode of a low contact potential and an apparatus for fabricating a compound semiconductor device are obtained. The method comprises a substrate cleaning step including a first cleaning step of heating a compound semiconductor substrate (1) containing a first conductivity type impurity in a temperature range of not more than 250(degree)C for etching its surface with hydrogen chloride and a second cleaning step of performing a radical hydrotreatment on the compound semiconductor substrate etched with hydrogen chloride after the first cleaning step.

INVENTOR:

Nakamura, Takao ...

...SPECIFICATION present invention relates to a method of fabricating a compound semiconductor device employed for an LED (light emitting diode) or the like and an apparatus for fabricating a compound semiconductor device, and more particularly, it relates to a method of fabricating a semiconductor device for a ZnSe-based LED employed for the backlight of a liquid display unit or the like and an apparatus for fabricating a compound...

...of the Prior Art

In order to drive a compound semiconductor device such as an LED , it is necessary to form an electrode on a compound semiconductor. For example, an electrode...

...on the back surface of a ZnSe substrate, in order to produce a ZnSe-based LED chip. However, such an electrode of ohmic contact cannot be readily formed on the ZnSe...

...be formed also on the aforementioned ZnSe substrate by fusing In.

In a ZnSe-based LED prepared by fusing In, however, various inconveniences result from the low melting point of In in solder reflow or transfer molding. When the ZnSe-based LED is heated to 200(degree)C to 250(degree)C, for example, ball-up results...

...ohmic contact is not formed, an unnecessarily high voltage must be applied to the overall LED , which in turn requires a large number of batteries and cannot be readily applied to the backlight for a liquid crystal display screen of a portable telephone or the like. Thus, strongly...on the interface that ohmic contact is not implemented, or voltage applied to the overall LED cannot be reduced even if ohmic contact is implemented. According to the aforementioned structure of...

...reducing a contact potential, thereby enabling reduction of the number of batteries necessary for the backlight of a liquid crystal display unit for a portable terminal or the like.

The aforementioned...

...carbon and hence ohmic contact is hard to implement or voltage applied to the overall **LED** cannot be reduced even if ohmic contact is implemented. When the compound semiconductor device is used as the **backlight** of a liquid crystal display unit for a portable terminal, therefore, the number of necessary...

...the back surface of the compound semiconductor substrate, for improving the fabrication yield of an **LED** emitting white light, for example, and reducing the fabrication cost.

In the aforementioned method of...C, further, the performance of a portion formed as the active layer etc. of the **LED** is damaged.

In the aforementioned method of fabricating a compound semiconductor device according to the...

...reducing a contact potential, thereby enabling reduction of the number of batteries necessary for the **backlight** of a liquid crystal display unit for a portable terminal or the like. Electric resistance...Fig. 6 illustrates the current-voltage characteristic of a back electrode of a ZnSe-based **LED** according to the present invention;

Fig. 7 illustrates the current-voltage characteristic of a back...

...Fig. 8 illustrates the current-voltage characteristic of a back electrode of a ZnSe-based **LED** according to the present invention;

Fig. 9 illustrates the current-voltage characteristic of a back...

...n) ZnSe film;

Fig. 10 is a sectional view showing a stage of forming an **LED** epitaxial multilayer film such as an active layer on the surface of an n-type...mounting the substrate 1. Also when preparing an electrode on a device such as an **LED**, the surface of the device is protected with an Au foil member due to this...low interfacial resistance of not more than 0.1 V, can be employed for the **backlight** of a liquid crystal display unit of a portable terminal for contributing to reduction of...

...according to the aforementioned embodiment and Example 1 thereof, except some conditions.

(1) First, an **LED** epitaxial film including an emission active layer etc. was formed on the surface of an...

...substrate shown in Fig. 1.

(2) Then, the n-type ZnSe substrate formed with the **LED** epitaxial film was bonded to a glass substrate with wax 25, as shown in Fig...

...member was inserted between the n-type substrate and the substrate holder, for protecting the **LED** epitaxial film on the surface side and implementing excellent thermal contact.

(6) Then, the aforementioned...Au film was deposited on this Ti film 5 by 50 nm, for obtaining an **LED** similar to that shown in Fig. 1.

(10) When measuring an operating voltage causing light emission in the **LED** fabricated through the aforementioned method, it was possible to obtain white light from the **LED** at a low value of 2.6 V. This is because it was possible to...

...contact potential on the back surface of the n-type ZnSe substrate.

When applying this **LED** to the **backlight** of a liquid crystal display unit of a portable terminal such as a portable telephone...

...in high efficiency with a high yield, to contribute to introduction of a low-priced **LED** having high performance into the market.

Although the present invention has been described and illustrated...

NOVELTY - An image is displayed on a display device at given
brightness. A color of the image displayed on the display device is
changed while maintaining the brightness of the image at a set value
when the color is changed. The display device has a number of light
emitters such as red, green and blue LEDS (1-3) by maintaining a sum of
currents flowing through the light emitters at a set current value
using a current controller (14).

DETAILED DESCRIPTION - An INDEPENDENT CLAIM is included for:

(a) a display device

USE - In a back-light display device of a portable electronic
device .

ADVANTAGE - Capable of developing a desired color for display and
maintaining intensity of brightness regardless of a displayed color.

DESCRIPTION OF DRAWING(S) - The drawing is a circuit diagram of one
embodiment of an RGB back light display device for a portable
electronic device according to the present invention.

red, green and blue LEDS (1-3)

Abstract (Basic): JP 9213310 A

The method involves applying an active coating material onto a collector body surface. The coating material is agitated with an agitator (1), which has an impeller (2) before applying to surface. The material is filtered for removing aggregate of the non-dispersion before applying to surface.

ADVANTAGE - Obtains uniform coating property. Improves yield. Obtains battery with wide discharge characteristics.
